Professional Summary

AI and backend developer with four years of experience shipping production systems, looking for a backend or AI-platform role. Built and operate the Python backend behind Magick Box, an AI creative app on the App Store, Google Play and the web, and magick_ai, the SDK that gives it generation across six AI providers. Most recently took Magick Whisper, a Go and Flutter app, from an empty repository to TestFlight in seven weeks.

Work Experience

General Magick Industries | AI & Backend Developer

Mar 2024 – Present

Bangkok, Thailand

Magick Box, AI creative platform on iOS, Android and the web [App Store](#) · [Google Play](#) · magickbox.ai

- Built and run the Python 3.12 / FastAPI backend behind every client: around 250 endpoints across 21 feature packages on a 58-collection MongoDB model, with a ranked feed, Redis caching and rate limiting.
- Exposed every generation type through magick_ai with credit-based tiers, so a new model ships as configuration rather than code.
- Moved long-running generation onto Celery with retries, backoff and time limits, so a provider outage fails one job instead of the API.
- Built Mini Cinema, a multi-shot AI film pipeline that streams reasoning, approval gates and renders to the client as typed content blocks.
- Built real-time and group chat over Socket.IO with token streaming, AI personas alongside human members, and pub/sub keeping pods in sync.
- Built billing on Stripe, RevenueCat and AdMob with signature-verified webhooks and an idempotent credit ledger, so retried webhooks never grant credits twice.
- Implemented device-bound JWT sessions, Argon2 hashing with transparent migration of legacy hashes, email OTP and Google and Apple sign-in, so existing users kept their accounts through the migration.
- Deployed to Kubernetes on AWS with Helm, Istio mTLS and autoscaling from one Docker image; GitHub Actions runs 181 tests, build, release and DAST scans on every change.

magick_ai, multi-service AI SDK for the Magick Box backend (private repository, access on request)

- Wrote and maintain the Python SDK behind Magick Box: one UniversalAgent call covers chat, image, video, music and podcast generation across OpenAI, Google, Stability, Replicate, Suno and AIML via LiteLLM. Around 280 modules, 35+ tagged releases.
- Built the agents on top: chat orchestration with per-type handlers and validators, a persona agent, podcast and storybook generators, and automatic tagging.
- Added document analysis (PDF, Word, Excel, PowerPoint), web search and prompt enhancement, with standardised results and one error model in place of six provider-specific ones.

Magick Whisper, dog-training companion for the Guardian collar (Aug 2026 – present, on TestFlight)

- Took the product from an empty repository to TestFlight in seven weeks: a Go API (Gin, pgx, PostgreSQL) and a Flutter app with Riverpod and go_router.
- Implemented Google and Apple sign-in against cached JWKS with 15-minute access tokens and rotating refresh tokens, kept optional to pass App Store guideline 5.1.1.
- Added on-device speech recognition with Whisper and Silero VAD, plus an offline session store with retry-safe uploads, so sessions record without a connection.
- Go tests run against a real PostgreSQL in CI and the build fails if any database test skips; Codemagic ships signed builds to TestFlight and Google Play.

Legal document RAG, two prototypes (Aug – Oct 2024) private repositories

- Built policyGraphRAG, a question-answering API over eleven Thai statutes: Microsoft GraphRAG per act with GPT-4o entity extraction, community summaries and LanceDB embeddings, served from FastAPI. Started the repo and built the indexing; a team of four added contract analysis.
- Built vision-rag, a multimodal RAG chatbot that indexes PDF pages as images with ColPali and answers with GPT-4o vision, so scanned statutes work without OCR.

Yoma Bank | Full Stack Developer

Dec 2022 – Mar 2024

Yangon, Myanmar

- Replaced the compliance team's manual data requests, which arrived as Excel exports from the core banking team, with a self-service Angular and Spring Boot web app.
- Designed the relational schema and SQL behind the reporting datasets, with indexed queries and paginated exports so large customer tables load without timing out.
- Built the Java REST APIs and an audit trail of who viewed which record, replacing untracked spreadsheet copies.

Education

Liverpool John Moores University

2021 – 2024

BSc Computer Network and Infrastructure, Liverpool, United Kingdom. Studied online alongside full-time work in Yangon.

Skills

Languages: Python, Go, Java, Dart, SQL, JavaScript, TypeScript

Backend: FastAPI, Pydantic, Gin, Spring Boot, REST and OpenAPI, Socket.IO, Celery, Clean Architecture

Databases: PostgreSQL (pgx, goose), MongoDB, Redis (caching, rate limiting, pub/sub)

Auth and security: JWT, OAuth and OIDC (Google, Apple), Argon2, webhook signature verification, DAST

AI: LiteLLM, OpenAI, Gemini and Veo, Groq, Stability, Suno, Kling, Flux, RAG (GraphRAG, ColPali, LanceDB), on-device Whisper

Testing and delivery: pytest, Go testing, Flutter tests, GitHub Actions, Codemagic, Docker, Helm, Kubernetes, Istio, AWS

Mobile and frontend: Flutter (Riverpod, go_router), Angular

Payments: Stripe, RevenueCat, AdMob server-side verification

Spoken languages: Burmese (native), English (professional), Thai (conversational)
