

Khaing Myal Htike

AI & BACKEND DEVELOPER

Bangkok, Thailand | +66 61 117 8681 | khaingmyalhtike3400@gmail.com | lulaz34.github.io | github.com/lulaz34 | linkedin.com/in/khaing-myal-htike-261705256

Professional Summary

AI and backend developer with four years of experience shipping and running production systems, looking for a backend or AI-platform role. Built and operate the Python backend behind Magick Box, an AI creative app live on the App Store, Google Play and the web: around 250 FastAPI endpoints, Stripe and RevenueCat billing and a Kubernetes deployment on AWS, plus magick_ai, the in-house Python SDK that gives it chat, image, video, music and podcast generation across seven AI providers. Most recently took Magick Whisper, a Go and Flutter dog-training app, from an empty repository to TestFlight in seven weeks.

Work Experience

General Magick Industries | AI & Backend Developer

Mar 2024 – Present

Bangkok, Thailand

Magick Box, AI creative platform on iOS, Android and the web [App Store](#) · [Google Play](#) · magickbox.ai

- Built and run the Python 3.12 / FastAPI backend that serves every client: around 250 REST endpoints across 21 feature packages on a 58-collection MongoDB model, with a ranked social feed, Redis caching and sliding-window rate limiting.
- Exposed every generation type through magick_ai (below) with credit-based model tiers, so a new model or provider ships as configuration rather than backend code.
- Moved long-running generation onto Celery workers with retries, exponential backoff and time limits, so a provider outage fails one job instead of the API; FFmpeg stitches podcasts and converts video.
- Built Mini Cinema, a multi-shot AI film pipeline that streams reasoning, approval gates and finished renders to the client as typed content blocks.
- Built real-time chat and group chat over Socket.IO with token streaming, AI personas alongside human members, @mentions and per-user unread counts, with pub/sub keeping conversations in sync across pods.
- Built billing on Stripe Checkout, RevenueCat and AdMob rewarded ads with signature-verified webhooks and an idempotent credit ledger, so retried or duplicated webhooks never grant credits twice and subscriptions reconcile automatically.
- Implemented device-bound JWT sessions with refresh rotation, Argon2 hashing with transparent migration of legacy hashes, email OTP and Google and Apple sign-in, so existing users kept their accounts through the change.
- Deployed to Kubernetes on AWS with Helm, Istio mTLS and horizontal autoscaling from one multi-stage Docker image serving web and worker; GitHub Actions runs 181 pytest tests, build, release and DAST scanning on every change.

magick_ai, multi-service AI SDK for the Magick Box backend [GitHub \(private, access on request\)](#)

- Wrote and maintain the Python SDK the Magick Box backend depends on: one UniversalAgent call covers chat, image, video, music and podcast generation across OpenAI, Google Gemini, Imagen and Veo, Stability, Replicate (Flux, Kling, MiniMax), Suno and AIML, with LLM calls routed through LiteLLM. Around 280 modules, shipped as 35+ tagged releases from 0.1 to 2.1.
- Built the agents on top of it: chat orchestration with per-type handlers, validators and processors, a persona agent (Magick Friend), podcast and storybook generators, and automatic tagging for content discovery.
- Added document analysis so chat can read user uploads (PDF, Word, Excel, PowerPoint) and answer from their contents, plus web search, prompt enhancement and history compression tools, standardised result entities and one error model in place of seven provider-specific ones. Media lands in S3 with metadata in MongoDB.

Legal document RAG, two retrieval prototypes (Aug – Oct 2024) [policyGraphRAG](#) · [vision-rag](#) (private)

- Built policyGraphRAG, a question-answering API over eleven Thai statutes (Copyright, Patent, Trademark, Immigration, Labour Protection, Land Code, Revenue Code and others): set up the Microsoft GraphRAG pipeline per act with GPT-4o entity extraction, community summaries and LanceDB embeddings, served from FastAPI with one endpoint per act. Started the repo and built the indexing; a team of four added contract analysis on top.
- Built vision-rag, a multimodal RAG chatbot that indexes PDF pages as images with ColPali through Byaldi, retrieves the top pages per query and answers with GPT-4o vision, so scanned statutes and tables work without OCR. Per-session indexes and uploads behind a FastAPI API.

Magick Whisper, dog-training companion for the Guardian collar (Aug 2026 – present, on TestFlight)

- Took the product from an empty repository to TestFlight in seven weeks: a Go API (Gin, pgx, PostgreSQL) with embedded migrations, and a Flutter app built with Riverpod and go_router.
- Implemented Google and Apple sign-in verified against cached JWKS, with 15-minute access tokens and rotating hashed refresh tokens, kept optional so onboarding passes App Store guideline 5.1.1.
- Added on-device speech recognition with Whisper and Silero VAD in a background isolate, plus an offline session store with retry-safe UUIDv7 uploads, so training sessions record without a connection.
- Go tests run against a real PostgreSQL service in CI and the build fails if any database test skips; Codemagic ships signed iOS and Android builds to TestFlight and Google Play.

Yoma Bank | Full Stack Developer

Dec 2022 – Mar 2024

Yangon, Myanmar

- Replaced the compliance team's manual data requests, where consumer records arrived from the core banking team as Excel exports, with a self-service web app in Angular and Spring Boot that lets them query the data on demand.
- Designed the relational schema and SQL behind the reporting datasets, with indexed queries and paginated exports so large customer tables load and export without timing out.
- Built the Java REST APIs and an audit trail recording who viewed which record, replacing untracked spreadsheet copies with a reviewable workflow.

Education

Liverpool John Moores University

2021 – 2024

BSc Computer Network and Infrastructure, Liverpool, United Kingdom. Studied online alongside full-time work in Yangon.

Skills

Languages: Python, Go, Java, Dart, SQL, JavaScript, TypeScript

Backend: FastAPI, Pydantic, Gin, Spring Boot, REST and OpenAPI, WebSockets (Socket.IO), Clean Architecture, dependency injection, async programming

Databases: PostgreSQL (pgx, goose migrations), MongoDB (aggregation pipelines, indexing), Redis

Async, caching and resilience: Celery, Redis caching, sliding-window rate limiting, idempotent webhooks, retries with backoff, FFmpeg

Auth and security: JWT, OAuth and OIDC (Google, Apple), Argon2, webhook signature verification, DAST scanning

AI: LiteLLM, OpenAI, Google Gemini and Veo, Groq, Stability AI, Suno, Kling, Flux, RAG (GraphRAG, ColPali, LanceDB), on-device Whisper (sherpa_onnx)

Testing and delivery: pytest, Go testing, Flutter widget tests, GitHub Actions, Codemagic, Docker, Helm, Kubernetes, Istio, AWS

Mobile and payments: Flutter, Riverpod, go_router, Angular, Stripe, RevenueCat, AdMob server-side verification

Spoken languages: Burmese (native), English (professional), Thai (conversational)
